... holding the paint-pot. The Commandments were written on the tarred wall in great white letters that could be read thirty yards away. They ran thus:

- THE SEVEN COMMANDMENTS
1. *Whatever goes upon two legs is an enemy.*
 2. *Whatever goes upon four legs, or has wings, is a friend.*
 3. *No animal shall wear clothes.*
 4. *No animal shall sleep in a bed.*
 5. *No animal shall drink alcohol.*
 6. *No animal shall kill any other animal.*
 7. *All animals are equal.*

It was very neatly written, and except that 'friend' was written 'freind' and one of the 'S's' was the wrong way round, the spelling was correct all the way through. Snowball read it aloud for the benefit of the others. All the animals

ALL ANIMALS ARE EQUAL BUT SOME ANIMALS ARE MORE EQUAL THAN OTHERS

1. <i>Whatever goes upon two legs is an enemy.</i>	2. <i>Whatever goes upon four legs, or has wings, is a friend.</i>
3. <i>No animal shall wear clothes.</i>	4. <i>No animal shall sleep in a bed.</i>
5. <i>No animal shall drink alcohol.</i>	6. <i>No animal shall kill any other animal.</i>
7. <i>All animals are equal.</i>	

Animal farm short answer questions. Animal farm movie questions answer key. Does animal farm have a movie.

During the day, spotted jellies typically orient themselves bell side down and tentacles up. Geological researchers found the crabs when looking for methane seeps in the ocean off of Costa Rica; the bacteria get their energy from the inorganic gases coming from sea vents. In reality, they bore through the wood and introduce the ambrosia fungi that they eat. Once a chamber is complete, the beetles carefully tend to their crop, which feeds both adults and larvae. Instead, they farm and sometimes, like humans, have difficulty with crop failures. A number of astonishing animals discovered agriculture long before humans evolved as a species. The crabs wave their claws to create movement in the water. In turn, feeds the bacteria with the oxygen and sulfide it needs to grow. In extreme cases, ants will clip off their domesticated aphids' wings to prevent them from flying away when they mature. The algae they prefer is a species that is weak and quickly over-grazed, compared to other species of algae. A common misconception is that these beetles eat the wood. David Siu / Flickr / CC BY-ND 2.0 Much like leaf-cutter ants, many termite species are fungus farmers. This position ensures the photosynthetic crop in their tentacles gets enough light. Joshua McMichael / Flickr / CC BY-SA 2.0 Several ant species herd aphids in much the same way that humans keep cattle for milk. Shane Ahoyng / Wikimedia Commons / A CC BY 2.5 Yeti crabs farm bacteria on their hairy claws. Many people believed these ants from Central and South America ate the leaves they collected. The fungus then grows into mushrooms, creating a food source for the termites. They spend most of their time chasing the daylight and tending their internal gardens. There are insects that practice husbandry, fish that farm, and even jellyfish horticulturalists. Brian Gratwicke / Flickr / CC BY 2.0 Spotted jellies, also known as lagoon jellies, grow algae food inside Fabrics. Although considered domestic pests, termites form some of the most complex animal societies. They are so protective towards their crops that attacked other creatures that swim too close " also divers. Instead of milk, aphids excrete a sugar liquid called dellato that the ants devour. Even more fascinating, ants typically bring their aphids into new pasture lands and protect them from predators. Then they feed the mushroom, not the leaves, with their larvae. To continue enjoying our site, we ask you to confirm your identity to be human. The gigantic eggs built by some colonies of termites are complex and temperature-controlled structures. They also encourage a mix of aphids, so as to have a balance between types. The ants do everything to take care of their aphids, often training them to defecate in a way that makes it easier for ants collecting and eating the mehlote. The termites begin to chew the vegetable material and nourish it with mushroom. Bridesmaid fish are algae farmers. Collect the leaves to cultivate a mushroom growing on the leaves. Mary Hollinger, Biologist Nesdis / Node, Noa / Flickr / CC by 2.0 Sprayed Littoraria (littoraria sprinkled), a type of snail that is typically located throughout the south-east of the United States, prefers to celebrate on a mushroom that cultivated in wounds up Cordgrass leaves. The Leaf-Cutter ants protect crops from parasites and molds. When the crab is ready to eat, use the parts of the comblike mouth to collect his meal from the bristles. These structures are essential to maintain the ideal cultivation environment for their fungal source of food. The beetles often leave a ring of what seems sawdust around the tree as they push the wooden shavings out of the holes they carry. wise snails use their rough, tongue-like radula to cut grooves into cordgrass leaves, creating the perfect growing environment for their favorite mushroom. Scientists also have snails sighted have their fields by defecating in the grooves, further helping the fungus grow. Farming was once believed to be a feat reserved only for big-brained hairless apes, but it turns out that animals don't need a central nervous system to tend crops. Henrik L / Getty Images Named after the fungus they cultivate, ambrosia beetles are bark borers that grow their crops within decaying trees. In fact, the well-trained aphids will often withhold their honeydew until they are stroked and "milked" by ants. Leaf-cutter ants aren't just farmers; they are factory farmers. Here's our list of seven amazing animal agriculturalists. Thank you very much for your cooperation. But you might be surprised to learn that humans were not the first farmers. If there's one trait that distinguishes humans from animals, it's the ability to grow food. Greg Grimes / Flickr / CC BY-SA 2.0 These feisty farmers are the only fish known to engage in agriculture. It tends to survive only within the protective territories of the damselfish. If it weren't for such dedicated farmers, the algae would be challenging to find. find.
